ATTACHMENT NUMBER TWO (2)

REQUIREMENTS LIST

s)

Form Approved

OMB No. 0704-0188

1 to average 220 hours per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Department of Defense, Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington, VA 22202-4302, and to the Office of Management and Budget, Paperwork Reduction Project (0704-0188), Washington, DC 20503. Please DO NOT RETURN your form to either of these addresses. Send completed form to the Government Issuing Contracting Officer for the Contract/PR No. listed in Block E.

A fully-implicit code to time-advance the 1-D MHD equations has been developed up to date specifically for modelling a capillary discharge (a radial dependence of parameters). Classical transport is assumed to have the correct dependence to within a multiplicative factor that can be specified at run-time. The atomic physics of the plasma is modelled using 0-D approximation where an "average" temperature and density are used to determine the ionization and recombination rates for the principal plasma species. These rates are then used to determine an "effective z " for the MHD model. It is assumed that the entire plasma is ionized to the same state. The model can currently treat elements up to $z=18$ (argon) due to limitations in the atomic physics portion of the code.

The code has been tested using some published data from carbon capillaries [2,4] and the best fit corrections to classical transport have been determined for that type of discharge. Normalization of the code for an argon plasma has not been done due to a lack of published experimental capillary discharge data.

An extensive literature search for the previous capillary discharge experiments was performed and the result of this search is summarized in the Table 1. These experiments cover a plasma temperature range $T_e = 1-100$ eV and a plasma electron density range $N_e = 10^{17}-10^{20} \text{ cm}^{-3}$.

From the point of view of plasma parameters a capillary discharge stays between z-pinch discharge ($T_e > 100$ eV, $N_e > 10^{20} \text{ cm}^{-3}$) and high current ion laser discharges ($T_e < 10$ eV, $N_e < 10^{15} \text{ cm}^{-3}$).

In paper [4] the authors claimed they had registered the bursts of an amplified spontaneous emission (ASE) at 18.22 nm 3-2 transition in a H-like C. Authors estimated a gain $\alpha \cong 2-3 \text{ cm}^{-1}$. The bursts were very short (a few nsec), not reproducible well, and they occurred only in the middle of a second half-period of the discharge. According to [4], increasing or decreasing the capacitance of discharge capacitor or inductivity of a discharge circuit depressed the occurrence of the bursts. No spectra of emitted lines were presented in the paper and no plasma diagnostics was performed.

In paper [9] a very high plasma temperature (100 eV) and density (10^{20} cm^{-3}) were reported for fluorine plasma, but it was not clear what was the feature size of such hot and dense plasma. These parameters are more likely connected with hot microscopic plasma volumes rather than with a bulk plasma. No spatially resolved diagnostics were reported here.

Table 1. Summary of various capillary discharge experiments to date. Here: U_0 , C_0 , L_0 , - discharge set parameters; I_0 - peak discharge current; j_0 - peak current density, Z - discharge impedance, $Z = \sqrt{L_0/C_0}$; E_0 - stored energy; $t/4$ - discharge current rising time; τ - discharge current exponential decay time; $d \times l$ - capillary geometry (diameter \times length); W - energy contribution into plasma (J/cm^3), $W = E/V$; P - power contribution into plasma (W/cm^3) $P = W/\tau$; T_e - plasma electron temperature (eV); N_e - plasma electron density (cm^{-3}).
